Model: GPT-5.6 Luna

Interaction 1

User

When I run this command I get Error 404 not found. do you know how to fix this
wget people.eecs.ku.edu/~l367r860/index.html

Assistant Summary

Explained that the tilde-like character was likely the problem and suggested using a normal ASCII `~` in the URL. Also suggested testing the directory URL and checking the KU web directory setup if the error persisted.

Interaction 2

User

This is the lab 3 instruction can you give me a guide to help me swiftly complete this lab while meeting all of the requirements. I have already completed step 1 of this assignment.

University of Kansas

EECS 348: Software Engineering I, Fall 2025

Lab 3: Web Programming: HTML, CSS, JavaScript, PHP

1\ Prepare the environment

To complete this lab, you will need access to either the cycle server or the lab machine. Now, let's go over how to set up the environment and efficiently complete your index page.

After logging into the cycle server (or using the lab machine), locate the public html folder. If it does not exist, create it. Next, open your terminal and run the following commands exactly as provided—do not modify the Canvas ID:

wget people.eecs.ku.edu/~l367r860/index.html

wget people.eecs.ku.edu/~l367r860/grant permission.sh

bash grant permission.sh

Don't copy and paste from this PDF file, as you may lose some letters.

Finally, open your browser and visit the following link: https://people.eecs.

ku.edu/~l367r860/ (Replace l367r860 with your Canvas ID.). If you can access the following page, you have successfully completed the first step. When creating a new file, remember to run the command bash grant permission.sh again.

University of Kansas

EECS 348: Software Engineering I, Fall 2025

Lab 3: Web Programming: HTML, CSS, JavaScript, PHP

The index file includes four links to our four practice exercises. If you choose to use my index file, ensure that your HTML files are named practice1.html, practice2.html, practice3.html, and practice4.html. For additional guidance, you can find useful resources on W3Schools. If any practice is unclear, feel free to refer to my example for clarification.

2\ Understand how People link works

Before starting the practice, I want to clarify a few points. The following explanations will not affect your practice, so feel free to skip them if you'd like.

What do the three commands mean? The first command downloads the index file. The second command downloads the script. The third command runs the script, which ensures that you have an HTML file and that it is accessible.

What does the link https://people.eecs.ku.edu/~l367r860/represent?

A URL (Uniform Resource Locator) represents an IP address, which corresponds to one or more servers. In this case, https://people.eecs.ku.edu/ points to the server at 129.237.87.16. The default port for HTTP services is 80, so when you access https://people.eecs.ku.edu/, you are actually reaching 129.237.87.16:80.

The server then serves the file located at /var/www/html/index.html. However, the server uses the KU network ID to forward you to your cycle server directory, specifically: /home/l367r860/public.html. That's why you must place your files in this folder—so they can be accessed through your web link.

Why do you need to run the script? When you visit a webpage, your browser downloads and parses the HTML, rendering it visually. However, for others (including me) to access your files, you must ensure they have the correct permissions. The script sets the file permission to 644, which means: You (the owner) can read and write the file ; Others can only read the file. Even if you don't run the script, you may still be able to access your site because new files are usually created with 644 permissions by default. However, the script ensures that the permission is correctly set, preventing potential access issues. If your files are not accessible, I won't be able to grade your work! So, always run the script after creating a new file.

Why doesn't the site change after changing my files? The server needs some time to update, and you need to refresh your browser. Important Reminder. You must ensure that your files are placed inside the public.html folder! If your files are not in this folder, they will not be accessible, and I won't be able to grade your work.

3\ Practices

1\ HTML profiles Create a profile page that is styled with CSS. Have fun with this! In this page, you must include some text, a photo, a hyper link and a video.

2\ CSS Font Control Create a web page that has a paragraph with some dummy text. Near the paragraph, have a text field to accept RGB values to form any colors for the paragraph and the border. You also need to control the width of the border.

3\ JavaScript Password Verification Create a JavaScript program that allows the user to enter a password two times to verify them. If the password is not at least eight characters long or if two passwords are different, alert the user. Otherwise, tell the user that two passwords are matched.

4\ PHP Multiplication Table Create a PHP program that receives a number and displays a multiplication table from 1 to the number. You also need to print the row and column indexes in the table.

5\ Publish Your Exercises You need to publish your practices to both People link and GitHub. At the same time, you need to make sure TAs can access your People Link.

3

Assistant Summary

Provided a fast, requirement-focused plan for Practices 1–4 and publishing. Suggested simple HTML/CSS/JavaScript/PHP implementations, testing each practice through the People URL, running the permission script after creating files, and then committing and pushing the files to GitHub.

Interaction 3

User

for practice 1 how do I copy an image's URL

Assistant Summary

Explained how to right-click an image in Chrome and choose "Copy image address," then place the resulting direct image URL in an HTML `` attribute. Warned that the direct image address is preferable to a search-results page URL.

Interaction 4

User

the practice4.php doesnt update the website

Assistant Summary

Suggested checking that the PHP file was in `public\_html`, rerunning the permission script, using the `.php` URL, forcing a browser refresh, and testing the file with the PHP command if available. Asked for command output if the problem continued.

Interaction 5

User

all other practices work exept for the 4th one. do you think its because of the .php. all other files have .html

Assistant Summary

Explained that `.php` is normally the appropriate extension for a PHP assignment and should not simply be renamed to `.html`. Suggested checking the exact URL, file existence, and permissions, and asked for the current PHP code.

Interaction 6

User

the only thing that the website says is
Apache/2.4.52 (Ubuntu) Server at people.eecs.ku.edu Port 443

Assistant Summary

Explained that the Apache message indicated the web server was responding but not successfully serving the requested page. Suggested checking the file, PHP installation, permissions, and testing the PHP file, then asked for the relevant command outputs.

Interaction 7

User

Look up the current KU EECS instructions for PHP on the People/Cycle servers

Assistant Summary

Searched current KU/EECS material and reported that PHP is part of the web-programming environment and that People/Cycle pages use `public\_html` with permissions. Suggested testing the PHP URL with `curl -I` and keeping the PHP extension until the cause was identified.

Interaction 8

User

So the problem was that it was named .php and not .html. I spoke with my TA and thats what he told me. ive done the checks and confirmed that the websites work. how do I upload this files to my Lab3 repository.

Assistant Summary

Explained how to copy the completed files from `public\_html` into a local clone of the Lab3 repository, then use `git status`, `git add .`, `git commit`, and `git push` to publish them.

Interaction 9

User

its saying that my repository doesn't exist even though it does

Assistant Summary

Explained that the likely causes were an incorrect Git remote URL or GitHub authentication. Asked the user to run `git remote -v` and `git push`, compare the remote to the actual repository URL, and avoid sharing credentials or tokens.

Interaction 10

User

can you tell me what im doing wrong?

```
x209e726@engr1005c-07:~/public_html$ vim practice4.php
x209e726@engr1005c-07:~/public_html$ rm practice4.php
x209e726@engr1005c-07:~/public_html$ vim practice4.html
x209e726@engr1005c-07:~/public_html$ pwd
/home/x209e726/public_html
x209e726@engr1005c-07:~/public_html$ cd ~/Lab3
bash: cd: /home/x209e726/Lab3: No such file or directory
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$ pwd
/home/x209e726/public_html
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$ cd ~/Lab3
bash: cd: /home/x209e726/Lab3: No such file or directory
x209e726@engr1005c-07:~/public_html$ pwd
/home/x209e726/public_html
x209e726@engr1005c-07:~/public_html$ pwd
/home/x209e726/public_html
x209e726@engr1005c-07:~/public_html$ cd ~/Lab3
bash: cd: /home/x209e726/Lab3: No such file or directory
x209e726@engr1005c-07:~/public_html$ pwd
/home/x209e726/public_html
x209e726@engr1005c-07:~/public_html$ cd Lab3
bash: cd: Lab3: No such file or directory
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$ mkdir Lab3
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html Lab3 practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$ cd Lab3
x209e726@engr1005c-07:~/public_html/Lab3$ cp ~/public_html/index.html ~/Lab3/
cp: cannot create regular file '/home/x209e726/Lab3/': Not a directory
x209e726@engr1005c-07:~/public_html/Lab3$ cp public_html/index.html
cp: missing destination file operand after 'public_html/index.html'
Try 'cp --help' for more information.
x209e726@engr1005c-07:~/public_html/Lab3$
```

Assistant Summary

Identified that the user had created `Lab3` inside `public\_html`, not at `~/Lab3`, and therefore the attempted copy path was wrong. Explained the distinction between the People website directory and a local Git repository, recommended removing the accidental empty

folder, cloning the GitHub repository, copying the completed files into the clone, and then committing and pushing.

Interaction 11

User

```
x209e726@engr1005c-07:~/public_html$ git clone git@github.com:Xavier-CE/Lab3.git
Cloning into 'Lab3'...
warning: You appear to have cloned an empty repository.
x209e726@engr1005c-07:~/public_html$ cd ~/Lab3
bash: cd: /home/x209e726/Lab3: No such file or directory
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html Lab3 practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$ ls
cgi-bin grant_permission.sh index.html Lab3 practice1.html practice2.html practice3.html practice4.html
x209e726@engr1005c-07:~/public_html$
```

Assistant Summary

Explained that the Git clone succeeded and created the repository at `~/home/x209e726/public\_html/Lab3`, so `cd Lab3` rather than `cd ~/Lab3` was needed. Then instructed the user to copy the five completed files into that cloned repository, run `git add .`, commit, push, and check GitHub.
